

1 to go through and just get your response.

2 One of them is for two-wire digital
3 loop Tech Pub 76750. Is that being utilized?

4 MR. SMITH: Mel Smith. No, it's
5 not. That one and 76740 and 76730 were
6 deactivated once the FCC made the ruling that we
7 could not apply our own technical standards to
8 DSL and for CLECs to comply with them. Those
9 were deactivated, and all references to them
10 were, I believe, taken out of this 76 TX.

11 MS. MALONE: Let's go off the
12 record for a second.

13 (Recess: 1:27 p.m. to 1:30 p.m.)

14 MS. MALONE: We'll go back on the
15 record. I just want to confirm, as far as DSL
16 in my DSL implementation docket hat, that
17 Southwestern Bell is seeking approval of Tech
18 Pub 76625 and 76860. Those are the only two
19 technical publications regarding DSL that are
20 being used and implemented by Southwestern Bell.

21 MR. SMITH: Mel Smith. Actually,
22 TP 76625 does not address DSL. It's DS1 and
23 DS3.

24 MS. MALONE: But it's specifically
25 referenced in Tech Pub 76860.

1 MR. SMITH: Yes, for the DS1 loop,
2 UNE loop, which is a repeater T1 UNE Loop, not a
3 DSL loop.

4 MS. MALONE: Okay. In a more
5 broad scope of technical publications under
6 Project 4000 (sic) in Section 2.17.1 of
7 Attachment 6 UNE of the T2A, Southwestern Bell
8 is required to file its technical publications
9 with the Commission and seek approval of those.
10 Has Southwestern Bell filed any technical
11 publications for approval?

12 MR. LEAHY: Other than these, no.
13 Tim Leahy, Southwestern Bell.

14 MS. MALONE: Are there other
15 technical publications other than the two
16 previously identified that would need to be
17 approved that are currently being used by
18 Southwestern Bell Telephone?

19 MR. SMITH: Mel Smith, none that
20 are being used. I've created one for line
21 sharing and I was just waiting to get the
22 details on the process of flowing it to the
23 Commission before I forwarded it on to you for
24 approval. But it's only on my PC.

25 MR. SRINIVASA: How about Pronto,

1 you know, the transport ATM cells? Are you
2 using any technical publication standards for
3 those? Are you going to file here for approval
4 as part of Project 20400?

5 MR. SMITH: Mel Smith. I'm not
6 aware of any technical pubs that have been
7 created for Project Pronto. I personally don't
8 work on that project. When we provide a UNE
9 offering, then I expect to update this tech pub
10 with it.

11 MR. SRINIVASA: How about for all
12 the T2A? You do have transports which although
13 C levels and DS1s through DS3, and there are
14 other unbundled network elements that you're
15 providing and technical publications for those
16 need to be approved. To the extent that it's
17 not the same as Bellcore standard or ANSI
18 standard, if it is something specific that's
19 used by Southwestern Bell such as your TP
20 designation, then you need to file that for
21 approval by the Commission, or even -- if you
22 reference to a TR, a Bellcore document or an
23 ANSI document, you need to -- exactly like you
24 have done in here, you need to do the reference
25 numbers in those TP documents for other UNEs.

1 MR. SMITH: Okay.

2 MR. SRINIVASA: Because that's
3 required under T2A.

4 MR. SMITH: Mel Smith. Does that
5 include internal MNP documents or just technical
6 documents that are to be shared with the CLEC
7 community?

8 MR. SRINIVASA: That are to be
9 shared with the CLEC community.

10 MR. SMITH: Okay.

11 MR. SIEGEL: Question. On Pronto
12 tech pub that, Judge Srinivasa, you just
13 referenced, just to make clear, even there is
14 debate on whether it's a (inaudible) service. I
15 think regardless of how that debate goes, you
16 want that tech pub for approval.

17 MR. LEAHY: And I think we made --
18 Mr. Smith made clear that he's working on a
19 document. There's no -- there is no such --
20 there's nothing final, nothing even a final
21 draft. He's trying to create a document in
22 anticipation of some of these issues, perhaps.

23 MR. SRINIVASA: Okay.

24 MS. MALONE: Have any technical
25 publications been approved by the FCC?

1 MR. SMITH: Mel Smith, not to my
2 knowledge.

3 MR. SRINIVASA: How about the
4 network interface devices? The same FCC
5 standards that you're using -- those are
6 standard interface devices, right, at the
7 customer premise are --

8 MR. LEAHY: Oh, okay. I'm not
9 aware -- you're talking about CPE or are you
10 talking about the NID?

11 MR. SRINIVASA: Interface devices.

12 MR. LEAHY: I don't know. I
13 would -- wouldn't the manufacturer get that
14 approved?

15 MR. SRINIVASA: Sometimes they do.
16 Yeah, most of them are approved. Manufacturers
17 will have to get an approval. And if there are
18 some proprietary interfaces that you're
19 installing, you have your own, then you would
20 have to provide the standards to the CLEC if
21 they need to connect at that point.

22 To the extent you're using standard
23 FCC-approved interfaces, it's available to them,
24 too, just like it is to you.

25 MR. LEAHY: Right.

1 MR. SRINIVASA: If it is something
2 you are using on your own, proprietary type,
3 then you would have to provide it.

4 MR. LEAHY: Based upon
5 information and I believe my experience is that
6 the SBC family of companies -- we don't
7 manufacture devices, so what we acquire would
8 come from manufacturers who -- I would believe
9 that we wouldn't acquire such devices until they
10 received necessary approval.

11 MR. SRINIVASA: To the extent it
12 is -- you know, the manufacturer has already got
13 an FCC approval or some other standard making
14 body's approval for that type interface, you
15 would reference to that. That reference -- if
16 you make that reference available to CLECs,
17 CLECs can look it up also.

18 But if you have some proprietary thing
19 that is custom manufactured just for you, hasn't
20 gone through FCC, then they need to know what it
21 is.

22 MR. SMITH: Mel Smith. Well, our
23 policy is to use only the FCC-approved or
24 industry standard body approved devices.

25 MR. SRINIVASA: To the extent you

1 do that, then it's no problem. If it is, then
2 you have to -- if you have any equipment that's
3 proprietary.

4 MR. SMITH: Okay.

5 MS. MALONE: Okay. Then I will
6 request that Southwestern Bell file a revised
7 tech pub. That's for both 76860 TX and 76625.
8 I looked over 76625, and a lot of the comments
9 that I had about 76860 would apply to 76625 in
10 terms of updating the references, adding the
11 language saying you reserve the right subject
12 to, you know, insert the exception here. So if
13 you could look at those and sort of anticipate
14 our concerns, that would be most helpful.

15 If you could file both of those and
16 any other technical publications should some
17 become effective and implemented and applicable
18 between now and then on August 9th, that gives
19 you about a week and a half of. Is that enough
20 time?

21 MR. SMITH: Yes.

22 MS. MALONE: Okay. And then we
23 will, again, give the CLECs a comment period to
24 respond to both of those tech pubs, and we ask
25 that comments be filed on August 16th. And all

1 of these filings should be in both dockets,
2 Project 20400 and Project 21165 so that all
3 parties receive adequate notice.

4 MR. LEAHY: Yes, Your Honor, Tim
5 Leahy for Southwestern Bell. To the extent that
6 what we've previously filed is voluminous, would
7 it be possible that we work with the CLECs and
8 have them send e-mails. To the extent that they
9 want this document, we'll give that to them, put
10 out a notice to that effect, but, frankly, the
11 volume is such that if we provide notice to
12 every participant in 20400 -- there's 50 boxes
13 like this.

14 MS. MALONE: The tech pub itself?

15 MR. LEAHY: Not the tech pub, but
16 it has the attachments. You don't want --

17 MS. MALONE: No, I don't need the
18 attachments anymore, just the actual document.

19 MR. RAJAGOPAL: Just this and
20 this.

21 MR. LEAHY: Okay.

22 MS. MALONE: I have ample
23 attachments now.

24 To the extent that there are any oral
25 comments today, we can go ahead and take those

1 quickly. But keep in mind you'll have the
2 opportunity to submit written comments at a
3 later date. Are there any comments?

4 MR. GOODPASTOR: I just had a
5 couple, and this will be included in written
6 comments to the extent that it doesn't change in
7 the refiling. Chris Goodpastor for Covad.

8 If you look at TP 6860 Texas, I believe
9 it's on Page 14 -- well, Page 13 -- actually, it
10 begins on Page 12 of the tech pub or Page 22 of
11 the filing -- Southwestern Bell appears to be
12 offering what's called an IDSL capable loop.
13 Later on in the tech pub it also offers an ISDN
14 capable loop, or I think they just call it a
15 two-wire digital loop.

16 In Covad's interconnection agreement
17 Southwestern Bell has agreed to provide IS --
18 basically, a two-wire digital loop, ISDN
19 compliant, that we can use for IDSL. In this
20 forum and in the past, we've had some
21 disagreements about provisioning problems that
22 Southwestern Bell has had with this loop in
23 provisioning IDSL. Covad's contention is that
24 if they provision a loop that complied with the
25 Bellcore standards for ISDN, then they wouldn't

1 have a problem. We believe it's a bug in their
2 DLC systems. That is their responsibility.
3 They believe that something different should
4 occur.

5 What I'm concerned about is the
6 introduction of an IDSL UNE that will result in
7 different rates and different performance
8 standards from what we have in our contract.
9 And so at this point, I mean, I'm not sure if
10 this is intended or not, I'm not making any
11 accusations, but the way this reads it appears
12 that it's another way to approach the issue that
13 is yet unresolved between at least Covad and
14 Southwestern Bell regarding provisioning of
15 IDSL. And so I just want to bring that to the
16 Commission's attention and we'll be addressing
17 this more fully in our comments.

18 MS. CHAPMAN: I can comment if you
19 would like. This is Carol Chapman. We are
20 developing a new IDSL capable loop product. It
21 will be available. When we have it fully
22 developed, we'll make that available to you.
23 The CLECs will still be able to order the
24 two-wire digital loop that we already have, but
25 this will be another loop offering that is

1 specifically tailored to IDSL, and that is what
2 this was intended to capture was what was
3 parameters around that offering.

4 It's not available yet because we
5 haven't rolled it out yet.

6 MS. MALONE: Are there any other
7 comments?

8 Okay. We'll move on to the next issue.
9 We'll go off the record for a second.

10 MR. MASON: Let's take five
11 minutes, and we will start up with IP's issues
12 first.

13 (Recess: 2:23 p.m. to 2:30 p.m.)

14 MR. MASON: On the record. We're
15 back, and we will now get into the list of
16 issues. I will first -- we can first talk about
17 IP's issues since they were timely filed. Thank
18 you very much. And the first one is
19 conditioning charges. I don't know if -- does
20 everyone have a copy of these list of issues so
21 it will be easy to address?

22 The easiest thing from past forums has
23 just been to kind of go down the list, and then
24 if anybody has any clarification questions we
25 can do that. So why don't we start with A, and

1 I'll ask whoever is most appropriate to address
2 that to address it.

3 MR. WELCH: My name is Mark Welch.
4 The question is regarding if SBC has a policy to
5 proactively delead or remove -- it says remove
6 loops within a binder group. I don't know --
7 really know the context of removing loops.

8 MS. GENTRY: It's loads. It's a
9 typo.

10 MR. WELCH: Loads, okay. Removing
11 the loads from a -- removing the loads can occur
12 on a couple of different ways. As far as
13 proactively, we don't have a policy to just go
14 out and send technicians out to proactively
15 deload cables across the 13-state region. There
16 is no such project or policy.

17 There are times when we do have to
18 remove loads, as you know. It could be that --
19 first, I think it's important to realize that
20 loads are put on cable when you're trying to
21 serve someone beyond 18,000 feet from the
22 central office. So if you were to use that as a
23 feeder for a remote terminal, the remote
24 terminal couldn't have loads on that pair, so
25 you would have to go out and deload the pair

1 that's going to feed that remote terminal unit.

2 There are certain retail services like
3 ISDN that don't work with load coils on there.
4 So you would have to go out and actually remove
5 the load coils for those. CLEC requests for the
6 two-wire digital or four-wire digital circuits
7 as well as the DSL capable services. So the
8 bottom line is there are certain times that you
9 do have to remove the loads, but, again, there
10 is no policy of going out and just sending
11 technicians out into the field to get into plant
12 when we don't have a need to be doing something
13 in that copper facility.

14 MS. GENTRY: Let me see if I can
15 clarify where my intent was. It's going back to
16 past discussions we've had here in the room, and
17 Mike Bellomy spoke to some of those before, but
18 I either did not hear him clearly, or by the
19 time it got to the Friday SBC-sponsored loop
20 qual discussion, it was not clearly stated.

21 What I'm trying to find out is -- let
22 me give you an illustration. I as a CLEC
23 request load coils taken off a specific loop.
24 That binder group's length is one that the
25 furthest loop is less than 18k. So nothing in

1 that binder group would need to be loaded by
2 current standards, by CSA standards.

3 When they take the loads off of the
4 specific customer I'm requesting, what are the
5 conditions that they proactively deload the rest
6 of the 25 binder group? Because I believe that
7 Mike Bellomy a few weeks ago told us that when
8 they can they do.

9 What then was said in a different forum
10 was only -- and then there are all these caveats
11 that got thrown behind it which totally muddled
12 the water about how proactively you're cleaning
13 up your plant. Because if you're out there
14 already, it's an incremental time to go ahead
15 and clean up additional ones which serves
16 everyone's purpose in the long-run.

17 I was hoping to hear that that was part
18 of a practice or when is it, and that's the
19 criteria I'm looking to have understand.

20 MR. MASON: Just to think about
21 and I guess one follow-up question, is there
22 any -- in that circumstance, would there be any
23 situations where you would affect another -- you
24 wouldn't want to do that. I'm just trying to
25 weigh -- I don't know.

1 MR. WELCH: I think that that -- I
2 mean, in the very specific circumstance that Jo
3 raises to me makes me think that we have a
4 copper pair that has gone out beyond 18,000 feet
5 and for some reason we've cut that entire copper
6 pair off.

7 Traditionally, that's not what's going
8 to happen. If the facility never went beyond
9 18,000 feet, the engineer wouldn't have put
10 loads on the copper facility.

11 MS. GENTRY: You've had
12 significant rearrangements through the years,
13 outside plant rearrangements.

14 MR. WELCH: Correct. Correct.

15 MS. GENTRY: I also know
16 historically that there have always been some
17 very conservative technicians that did load
18 things under 18 feet -- 18,000 feet in the
19 industry. If you don't want to admit that SBC
20 does, then tell me you've never, never done
21 that, and I will feel good.

22 I know with my history at US West they
23 will tell you that there were very conservative
24 engineers that did load under 18,000 feet or
25 that you've had significant plant rearrangement,

1 and what the loops were at one time they were
2 loaded. They now are under 18,000 feet; they
3 don't need to be loaded. And, again, my frame
4 of reference is another ILEC who has
5 proactively -- when they're there, they clean up
6 the plant because they know it takes
7 incrementally more minutes, but it is better for
8 everyone concerned.

9 I'm trying to find out if SBC has that
10 when the binder group you're in is no longer
11 than 18,000 feet, up to that, are you
12 proactively and what are the circumstances
13 you're doing it?

14 MR. WELCH: I think that the
15 answer again is that we don't have a policy that
16 says these are the guidelines that the engineer
17 will use every single time. We rely on our
18 engineers to use sound engineering judgment. If
19 they're looking at this facility and they're
20 engineering at a request of a wholesale customer
21 or a retail customer and they're in that
22 facility, they're going to look at the forecast
23 of services that they think they're going to
24 provide across that entire facility.

25 If they think there's an opportunity

1 that they're going to have to use that facility
2 to provide a service that requires the loads,
3 then they're going to have to look at the
4 forecast and say how many are going to require
5 loads versus how many may not require loads and
6 use their engineering judgment to decide what
7 they're going to do going forward.

8 But as far as a 13-state policy, there
9 just isn't anything that is like that. We rely
10 on the actual engineers.

11 MS. GENTRY: Your illustration
12 back to me was when you would need to be loaded.
13 Go with the concept it's under 18,000 feet.
14 There's never a circumstance that you need to
15 load something under 18k by CSA standards. So
16 with that said -- and again, I think you're
17 trying to tell me you have no policy, you have
18 no criteria, you don't do it, and if it happens
19 to get done it's a wonderful accident. If that
20 is what it is, I was just trying to see if we
21 had any proactive cleaning of the plant.

22 MR. WELCH: Do you want to add
23 something?

24 MR. BELLAMY: Mike Bellomy with
25 Southwestern Bell, and I did answer that

1 original question. And I went back to verify
2 what we have done in Texas and where we are, and
3 we found that the plant in Texas was built, that
4 there effectively are no loads less than 18,000
5 feet. If the engineer at the request of the
6 CLEC does go in and look at the plant to see
7 what the plant looks like, then if they should
8 find a load -- and there are situations where
9 they may have found that a particular cable was
10 loaded -- if they do find a load, they do look
11 at the entire complement of that.

12 But we have not found in Texas an
13 occasion to go in and deload everything. We
14 have found just a few loaded situations, and, in
15 that case, typically, it was a much longer cable
16 and they could not remove all of the loads for
17 DSL because those loads were placed there to
18 provide the POTS service. And if they were to
19 remove them, then we lose the capability of POTS
20 service beyond that 18k feet.

21 So in Texas, we did not go in and
22 remove the entire complement.

23 MR. SRINIVASA: Cable route, you
24 know, you are serving a cluster of subscribers.
25 Some are 15,000 feet, 16,000 feet, 18,000,

1 18,500, 18,900. You can go on. It's all the
2 same cable pair. You're extending them out. So
3 do you look at anyone who is beyond that and
4 only on those pairs you add the load coils?
5 It's all the same bundle, cable bundle. It's a
6 cable route.

7 MR. WELCH: Again, I think the
8 answer to that is that the cable route goes out,
9 and then you're going to taper it and you're
10 going to do different things as a part of
11 engineering. So to say that you do the same
12 thing to the entire 500 -- 1200 pair cable, I
13 don't know that that's necessarily what we're
14 saying because it's going to taper in certain
15 places, and certain things are going to happen.

16 But to the extent that a cable does go
17 beyond -- is to serve the customers beyond
18 18,000 feet, yes, we would load everything to go
19 out there because we want the flexibility to be
20 able to serve those customers. I can't think of
21 any instances where we would automatically load
22 something for a cable that's not getting out
23 there.

24 MR. SRINIVASA: Let's say you
25 started out with 600 pairs and tapered down at

1 the end 100 pairs. All those 100 pairs were
2 beyond 18,000 feet. When you install load
3 coils, you have to install the first one at
4 3,000 feet, 6,000 feet, 6,000 feet spacing, and
5 the last one H88 -- Is that what you use?

6 MR. WELCH: It's H88 loading.
7 Correct.

8 MR. SRINIVASA: So you have to use
9 certain spacing. That means those 100 pairs
10 have to have load coils all the way back up to
11 the central office.

12 MR. WELCH: Correct.

13 MR. SRINIVASA: Say, for example,
14 in addition to those 100 pairs, if you had some
15 other 50 pair or you changed it for some reason,
16 you moved one of those pairs to somebody else in
17 the distribution interface or somewhere, do you
18 go back and remove all of the load coils, or
19 what do you do?

20 MR. WELCH: Again, if we're
21 doing -- say, you had a cable, a 200 pair cable
22 that went out beyond 18,000 feet and you decided
23 to use a 100 pair of that cable at 15,000
24 thousand feet, okay, but we had originally
25 loaded the entire cable all the way out, no, we

1 wouldn't proactively send our technicians back
2 because the load coils don't negatively impact
3 the POTS service if they're in there.

4 MR. SRINIVASA: Okay.

5 MR. WELCH: Again, we wouldn't
6 send technicians out in the field to do work.
7 We have other things we need them to do to help
8 provision service and to place new cables and do
9 the things that we need, and it's not impacting
10 the service that we're trying to provide. So if
11 for some reason you tapered the cable back, no,
12 the answer to that is no, we wouldn't just for
13 no reason at all send a technician out and open
14 up those splices and remove the loads.

15 MR. SRINIVASA: If an ISDN service
16 is requested by one of those, if you need to
17 remove that -- you know, if you need to put a
18 line extender to go beyond 18,000 feet, you
19 still have to remove the load coils on those.

20 MR. WELCH: That's correct.

21 MR. SRINIVASA: So you would only
22 remove load coils on those pairs? Again,
23 engineering judgment would allow the engineer --
24 he would probably look at it and say, "If I know
25 this cable has been cut off," then, you know,

1 good engineering judgment would say, yes, he
2 could go in and remove the loads on cables that
3 he didn't have a forecast for service that
4 required that."

5 I agree with Jo. It's important to
6 note that when you are talking about deloading
7 the cable, it's the prep work associated with
8 getting into the cable that takes the highest
9 percentage of the time. I mean, that's, you
10 know, in a four-hour per load, that's going to
11 be the largest percentage of the work. Actually
12 going in and removing individual loads on one
13 cable versus multiple cables is a slightly
14 incremental cost.

15 MR. SRINIVASA: Okay.

16 MS. GENTRY: Yes, I was --

17 MR. SRINIVASA: Their practice is
18 you know --

19 MS. GENTRY: Yes, I have a better
20 sense of what their working practice is. Thank
21 you.

22 MR. MASON: Okay. Well, looking
23 at the issues list, since the answer is that
24 it's up to engineering -- to the individual, it
25 looks like we skip down to a few, unless you

1 want to go over those.

2 MS. GENTRY: Let's just clarify on
3 B. When they do -- someone has determined it's
4 appropriate to take off all the load coils even
5 though the initiated reason he went out was for
6 a specific order, do they update all their
7 records in that binder group that they've
8 deloaded? Do they go through to the LFACS
9 database through whatever means and reflect
10 those changes throughout?

11 MR. WELCH: If the engineer
12 decided to remove additional loads, he would
13 have to do a job, and that job would be what
14 drives the work out in the field. So that job
15 is going to then be handed over to his records
16 clerk, and the records clerk will put that
17 information into the databases. That's just
18 day-to-day. Engineers do jobs. They give it to
19 their clerks. The clerks update the databases.

20 MR. SIEGEL: But in this case the
21 engineer will have done work beyond what's on
22 the job.

23 MR. WELCH: No, sir. That's what
24 I'm saying. The job itself is the entire job.
25 If it's to remove one load coil, that's the job.

1 If he decides that although the request was only
2 for one and he removes 10, 10 is still the job.
3 If he only put one on the job, the person in the
4 field would only remove that one. So the
5 engineer has to issue the job to drive the work
6 that actually occurs in the field. And then
7 while it's being done in the field, it also goes
8 to the records clerk who then updates the
9 databases so it should stay in synch.

10 MS. GENTRY: So it's not a field
11 technician subjective decision. He only
12 decides -- the engineer that was back at the
13 office, so to speak, who determined what needed
14 to be done, he just follows that instruction
15 down the line. If they said do ten, he does
16 ten. If they say do one, he does one. Correct?

17 MR. WELCH: I'd say that's --
18 that's what our technicians better be doing.
19 Yeah.

20 MR. SRINIVASA: Okay.

21 MS. GENTRY: And then I think
22 we're down to the E, which is something that
23 I've brought up before. And let me just say
24 that SBC has formed a loop qual team that's --
25 that has CLEC representation and SBC

1 representation. We meet every Friday via
2 conference call.

3 It's a good place to bring questions.
4 Unfortunately, it takes weeks to get answers.
5 So I know it's a process, but what I've asked
6 every team that I attend, which are dozens a
7 week within SBC, I'm asking people to help
8 support the person that chairs that team. He
9 doesn't have enough SBC people behind him to
10 provide him answers.

11 So with that said, that's why some
12 things come back here because they aren't
13 answered in a manner -- and so we can debate
14 that or whatever, but the point is that it's a
15 nice team. It's a good place to bring questions
16 except they don't get answered very quickly. Or
17 he gets a technician from South Texas on the
18 line and he tells us his local practice. That's
19 really nice to know, but that doesn't tell me
20 what SBC does and that doesn't tell me about the
21 whole state of Texas.

22 I need to be sure he is addressing SBC
23 policy, which you should have no issues that are
24 Texas unique unless you've identified them that
25 way. When you're speaking, I assume you're

1 speaking SBC throughout. And so a South Texas
2 engineer who speaks his local practice doesn't
3 help me.

4 So that's where some of my questions
5 come from. Let me go to like E. Is SBC working
6 on a process to expedite when the information is
7 incorrect? I believe you remember I brought
8 that up before here. I go into the loop qual.
9 I go into it -- and I'm not going into
10 distribution area. I'm going into LFACS or I'm
11 going into manual. So go with the one that I go
12 into LFACS. That's your database today.

13 I take your information at face value,
14 and I submit my order accordingly. On due date
15 we find out there's a load coil. Let's take the
16 very simplest example. Is SBC in a position
17 that they will work with me to try to expedite
18 that order so the due date is no longer than it
19 would have been when I initially submitted my
20 order? And I'm talking about UNE loops. We're
21 not talking line sharing. I have a five-day
22 interval in Texas for nonconditioning. I have a
23 ten-day interval for conditioning. On Day 5, on
24 due date, we find out there is a load coil. And
25 it is SBC that can find out there is a load
